

Premier Design & Build

Full website redesign for a national general contractor. 850+ projects, 89M+ sq ft. Built end-to-end in Wix Studio with Velo animations and a CMS, responsive from 3300px to 390px.

Web Design

Wix Studio / Velo

CMS

Responsive

Brand

Three months. Every page in the nav.

Premier Design and Build has 850+ completed projects, 89M+ square feet built, 8 offices, and 150+ employee owners. When I started as their Web Development Intern, I got to own a full redesign and rebrand from wireframe to launch — shifting the site from an employee-first presentation to one that leads with the work itself. I'd never built inside a CMS or Wix Studio before.

MY ROLE	Web Development Intern	TIMELINE	3 months
TOOLS	Wix Studio, Velo (JavaScript), Figma, CMS	TYPE	Live professional website

850+

Projects completed

89M+

Square feet built

3300px

Down to 390px

Market sectors designed

Lead with the work, not the company.

A prospective client evaluating a national contractor for a multi-million-dollar build checks the website first. The core shift I was designing around: move from an employee-first presentation to one that leads with the projects as proof of what the company can do. Scale needed to be visible immediately, and navigation needed to hold up across eight market sectors, dozens of projects, leadership bios, careers, and a blog.

Mapping everything in Figma first.

Before opening Wix Studio I mapped the site's information architecture in Figma. I used AI to generate the initial wireframe structure — it gave me a skeleton to react to quickly. Then I went in and redesigned it myself: moving sections, rethinking the hierarchy, cutting what didn't belong. The AI got me to a starting point faster. The decisions about what actually stayed were mine.

THE DECISION

Let AI generate the skeleton, then rebuilt the hierarchy by hand — speed for the first draft, judgment for what actually stayed.

Site map — AI-generated structure, then redesigned from scratch

Homepage wireframe — layout worked out before touching Wix

Building the design system.

Before I designed anything in Wix, I worked through a full style guide in Figma. The style guide I was given had a lot of options — multiple font weights, accent patterns, button variants, an orange color that read as an error state, and a font that just didn't fit anywhere on the page. I didn't use any of those. What made it to the live site was a tighter set of intentional decisions: Montserrat Bold and Regular for type, a navy and teal palette, and one button shape. Everything that didn't earn its place got cut.

THE DECISION

Cut the orange accent and the mismatched display font. Kept Montserrat, one navy/teal palette, one button shape.

Style guide — a starting point, not a final answer

Internship page — corner radius and spacing system applied

Containers, corner radius, and the right gap value.

The contained feel of every section comes from one rule applied consistently: width: $\text{calc}(100\text{vw} - 32\text{px})$ on desktop, $\text{calc}(100\text{vw} - 28\text{px})$ on mobile, with 8px padding on all four sides — that gap is what gives every container its floating, rounded feel. Corner radius scales with it, from 15px down to 10px at the smallest breakpoint. The blog was the clearest exception: the native Wix blog template works better full-bleed, so I dropped the radius container there. Knowing when to step outside the system is part of having one.

THE DECISION

48px felt too safe, 24px was close but off — landed on 32px desktop / 28px mobile, with radius scaling 15px down to 10px.

Careers page — 30px containers, 8px padding, full-bleed hero

Learning the CMS as I built on it.

CMS was new to me — I learned it as I went, structuring projects, testimonials, and team bios as repeatable content types instead of hard-coded page elements. The CMS was also the most time-consuming part of the whole project: days of entering hundreds of project titles, descriptions, locations, types, tags, and image galleries one by one. Once everything was in, the design challenge began — every project photo was completely different. The fix was centering every photo so the subject stays in frame, then placing the project name behind a semi-transparent layer that breaks the text from the image.

THE DECISION

Centered every photo so the subject stays in frame, then dropped the project name behind a semi-transparent layer — works on a glass facade and a dark warehouse alike.

CMS backend — each row is one project entry

Projects grid — centered photos, opacity text layer

Delancy project detail page

Motion, mostly built-in — and navigation for two screen worlds.

Motion. I leaned on Wix Studio’s presets for global scroll reveals — good enough, and I didn’t want to over-engineer what already worked. I stepped away from them when they felt busy: the project detail page has no animation at all. The one custom piece was a number counter, built in Velo since Wix doesn’t have that built in.

Navigation. The nav had to work across a wide range of screen sizes without feeling like two different sites. Desktop is a clean horizontal bar; mobile collapses to a hamburger that opens a full-screen menu, reconsidering spacing and touch targets rather than just shrinking down.

THE DECISION

Presets everywhere except where they added noise — no motion at all on the project detail page, and one custom Velo counter.

Desktop navigation

THE PAGES — FOR REFERENCE

Every page in the nav, shipped live.

The process above is the real story — this is one of six finished pages it produced.

Home page shown above

Home

Leads with scale, visible immediately.

About

100% employee-owned — the culture story.

Careers

Open roles plus six internship tracks.

Projects

Filter by sector, detail page each.

Blog

Full-bleed — stepped outside the system.

Contact

Form built to feel like a real next step.

Writing copy, then revising it together.

I wrote the copy section by section, thinking about what each one actually needed to do — the homepage had to lead with scale, About had to carry the employee-ownership story, Careers had to sound like an actual opportunity. Once I had a draft, I sat with the creative director and went through it line by line. That back-and-forth changed layout decisions and how sections flowed into each other, and taught me more about brand voice than writing alone would have.

What I'd do differently.

I'd lock the CMS structure before touching any visual design — I built the style guide first, then had to rework a few field types once the Projects and Blog collections were actually populated. I'd get the creative director in the room earlier for copy, not just at the end. And I underestimated how long mobile nav interactions take to feel right — I'd budget far more time for that specifically.

RESULTS

Live. All of it.

Every single page in that nav is real and shipped, not a mockup. The marketing team can update content without touching a line of code, the design system holds up from a 390px phone to a 3300px monitor, and the projects filter actually works. Somewhere out there right now, a prospective client for a multi-million-dollar build is scrolling through something I built.
